CERTIFICATE OF MAILING

I hereby certify that this correspondence or fee is being deposited with the United States Postal Service via "Express Mail", Express Mail No.: EK889605197US to addressed to: Box Patent Application, Assistant Commissioner for Patents, Washington, D.C. 20231 on this date: January 19, 2001.

ATTORNEY DOCKET No.: ESFT-001/00US

CLIENT No.: E8781-2001

FIELD OF THE INVENTION

[001] The present invention relates to software management systems and, more

particularly, to systems and methods for selecting, ordering, installing, managing,

updating, and if necessary, uninstalling software applications provided to an entity by one

or more application service providers (ASPs) or other sources.

BACKGROUND OF THE INVENTION

[002] Recently, substantial attention has been directed to the field of software

management tools. One reason for this is that many vendors or purveyors of software

now distribute their products directly to customers via wide area networks such as the

Internet. Such vendors often are referred to as "Application Service Providers" or

"ASPs." Generally, businesses use ASPs as a means for outsourcing information

technology (IT) functions to specialists. Moreover, rather than purchasing expensive

software, high-powered computers, high-end telecommunications equipment, and the

like, companies often now choose to rent or lease applications from ASPs, and they often

access or use selected applications through the Internet. While this model allows

companies to achieve significant savings from a hardware and software purchasing and

maintenance perspective, the model may introduce significant management issues, where

for example, multiple ASPs provide applications to a single entity.

105130 v1/BD 294@01!.DOC 011901

W.

ATTORNEY DOCKET No.: ESFT-001/00US

CLIENT No.: E8781-2001

[003] Accordingly, it is believed that businesses may find systems, methods, and

applications for managing ASP relationships to be quite useful.

SUMMARY OF THE INVENTION

[004] In one particularly innovative aspect, the present invention is directed to systems

and methods for enabling a company to manage its relationships with one or more ASPs,

or other software sources. In one presently preferred embodiment, an applications

management server may be deployed within a company and used to interface with a

master database server and the servers of one or more ASPs. The interface preferably

occurs via the Internet, thus enabling a personal computer, web computer, or other

network appliance coupled to the management server to interact with the master database

server and the servers of the ASPs.

[005] For example, using a browser application provided on a personal computer, it is

possible interact with the management server and query the master database server to

identify those applications, services, and subscriptions that are available, as well as those

which are currently being utilized within a company. Further, through the use of an

appropriate graphic user interface (GUI) a user of the browser may add selected

applications, functions, or capabilities to the company network, and the user may remove

applications, functions, or capabilities that are no longer needed by the company. The

result of these actions may be communicated, for example, through the Internet to the

master database server, and the master database server may thereafter interact with any

CLIENT No.: E8781-2001

relevant ASP servers to enable or disable selected applications, functions, or features. In

addition, the master database server may provide electronic messages to any personnel

having responsibility for tasks necessary to carry out a transaction or complete an action.

[006] Accordingly, it is an object of the invention to provide improved systems,

methods, and applications for managing ASP relationships over a wide area network,

such as the Internet.

BRIEF DESCRIPTION OF THE DRAWINGS

[007] Various objects and advantages and a more complete understanding of the present

invention are apparent and more readily appreciated by reference to the following

Detailed Description and to the appended claims when taken in conjunction with the

accompanying Drawings wherein:

FIGURE 1 is a block diagram illustrating a system for managing ASP and other

relationships over a wide area network, such as the Internet, in accordance with a

preferred form of the present invention;

FIGURE 2 is a block diagram illustrating the components of a software subscription

management module in accordance with a preferred form of the present invention;

FIGURES 4(a)-4(d) comprise a series of screen images that may be used by a GUI in

accordance with the present invention.

DETAILED DESCRIPTION

[008] As shown in FIGURE 1, in one presently preferred form, a system 10 for

managing ASP and other relationships over a wide area network 16, such as the Internet,

may comprise an applications management server 12, a personal computer, web

computer, or other network appliance 14, a wide area network 16, a master database

server 18, and a plurality of ASP servers 20(a) and 20(b). The applications management

server 12 and the master database server 18 may be implemented using standard PC

compatible hardware including, for example, a 400 MHz CELERON® processor

manufactured by Intel Corporation. However, in one presently preferred form, the master

database server 18 comprises a 733 MHz PENTIUM® processor manufactured by Intel

Corp., 512 MB of RAM (or other suitable memory), and AMI Megaraid SCSI RAID

hardware configured to make three 9G disks look like one 18G disk in RAID5 mode.

The applications management server 12 preferably comprises a 500 MHz CELERON®

processor manufactured by Intel Corp., 64MB of RAM (or other suitable memory), and a

10.2 GB hard disk drive.

[009] The applications management server 12 and master database server 18 may be

coupled to the Internet 16 via dial up, ISDN, DSL, or any other protocol that supports

TCP/IP. The master database server 18 also may employ database management software

105130 v1/BD 294@01!.DOC

011901

ATTORNEY DOCKET NO.: ESFT-001/00US

CLIENT No.: E8781-2001

available from any of a number of vendors including Microsoft Corp., Oracle Corp., and

Sleepy Cat, Inc.

, and

gi. ď.

ij.

[010] The applications management server 12 may be deployed within a company and

used to interface with the master database server 18 and the servers of one or more ASPs

20(a) and 20(b). The interface preferably occurs via the Internet 16, thus enabling a

personal computer, web computer, or other network appliance 14 coupled to the

applications management server 12 to interact with the master database server 18 and the

servers of the ASPs 20(a) and 20(b).

[011] For example, using a browser application (not shown) provided on the personal

computer 14, it is possible to interact with the applications management server 12 and

query the master database server 18 to identify those applications, services, and

subscriptions that are available, as well as those which are currently being utilized within

a company. Further, through the use of an appropriate graphic user interface (GUI), a

user of the browser (not shown) may add selected applications, functions, or capabilities

to the company network, and the user may remove applications, functions, or capabilities

that are no longer needed by the company. The result of these actions may be

communicated, for example, through the Internet 16 to the master database server 18, and

the master database server 18 may thereafter interact with any relevant ASP servers 20(a)

and 20(b) to enable or disable selected applications, functions, or capabilities. In

addition, the master database server 18 may provide electronic messages to any personnel

105130 v1/BD 294@01!.DOC 011901

ATTORNEY DOCKET NO.: ESFT-001/00US

Ü

E E

ij)

[012] In one presently preferred embodiment, a software subscription management

module 50, shown in FIGURE 2, will be configured on the applications management

server 12, and the software subscription management module 50 may comprise a graphic

user interface (GUI) submodule 52 and a backend support submodule 54. As will be

described in more detail below, using a typical browser application, such as Microsoft

Explorer® or Netscape Navigator®, the user (not shown) of the personal computer 14

may access the GUI submodule 52 provided on the applications management server 12,

and by interfacing with the GUI, may view a list of applications, services, or capabilities

that are provided on a network (not shown) of a company, as well as, a list of

applications, services, or capabilities that are available for use by the network. The user

also may access historical data relevant to the network using the GUI.

[013] In a preferred form, all queries issued by the applications management server 12

are in the form of hypertext transfer protocol (HTTP) requests and include a unique ID

for the management applications server as part of a Uniform Resource Locator (URL).

Those skilled in the art will appreciate, however, that other communications protocols,

such as file transfer protocol (FTP) or hypertext transfer protocol secure (HTTPS), also

may be used for queries issued by the applications management server 12.

105130 v1/BD 294@01!.DOC 011901

ATTORNEY DOCKET NO.: ESFT-001/00US

CLIENT No.: E8781-2001

[014] Turning now to a description of the GUI, the GUI 100, shown in FIGURE 3,

preferably includes a subscription management item 102 and, if desired, a subscriptions

history item 104. The subscription management item 102 may be used to retrieve a

display of all applications, services, and capabilities that are available to the network,

together with a plurality of "subscribe" and "unsubscribe" buttons 106(a) and (b) for

enabling a user to select one or more offerings for use by the system. The subscriptions

history item 104 may be used to display, for example, a chronological history of those

offerings that have been utilized by the network in the past.

[015] Using the GUI 100, a system administrator 14 can retrieve a list 107 of available

applications or services, and using the displayed list, the administrator 14 can select

desired items to be installed on the applications management server 12, or other servers

(not shown), within a local area network (LAN) or wide area network (WAN). The

administrator also may view a history of all applications or services that have been

selected for use within network over a prescribed period of time.

[016] Preferably, the GUI 100 issues back-end commands that will cause any necessary

HTTP requests to be generated, and information returned from the applications

management server 12 or the master database server 18 will be parsed, formatted, and

sent to a standard output. The GUI 100 may then read in the output from the back-end

process and display the information to the administrator 14 along with any necessary

interactive items, such as the subscribe and unsubscribe buttons 108(a) and (b) described

above.

M. Pierra

D

E. E

igi,

105130 v1/BD 294@01!.DOC

011901

ATTORNEY DOCKET No.: ESFT-001/00US

CLIENT No.: E8781-2001

[017] Preferably, whenever a list 107 of available services or applications is presented

to an administrator, the list 107 will include all available applications or services, and the

administrator 14 will be allowed to select services or applications for subscription or

cancellation. The history item 104 may be used to display a chronological history of

selected services or applications.

[018] Turning now to FIGURES 4(a)-(d), in accordance with another preferred form of

the present invention the GUI 100 may include a series of screen images that include a

field 111 denoting the number of application licenses 110 that may be required for a

given enterprise and a list of services or applications 107 that are available to the

enterprise. If it is desired to change the number of licenses required by the enterprise, a

user of the system may simply click on a change button 112 to access, for example, a

pulldown menu (not shown) offering different licensing levels. The user also may initiate

a subscription sequence by clicking on a subscribe button 106(a) provided adjacent one

of the application listings. Following initiation of the subscription sequence, the user

may be presented with another screen 103, which includes a download now button 114

for initializing an application download sequence and an unsubscribe button 106(b)

adjacent the selected application. If the user clicks on the download now button 114 an

application download sequence will be initiated, and the user may be presented with a

new screen 105 including an install now button 116. By clicking on the install now

button, the user may cause the selected application to be installed on the applications

management server 12 or, if desired, on another server (not shown) included within the

users LAN. Lastly, one the selected application has been installed, the user may be

105130 v1/BD 294@01!.DOC

'#. I

Extended to the

4

CLIENT No.: E8781-2001

presented with a screen 109 that includes a check icon 118 adjacent the service that has been selected and installed upon the user's network.

[019] Table 1, below, provides an exemplary representation of the components comprising the subscriptions management item 102 (shown in FIGURE. 3), wherein "xxx" comprises the name of the service or application that will be subscribed to or unsubscribed from.

Table 1

Form Field Name	Form Field Type	Corresponding ti.conf Variable	Appears in Form
subscribe_xxx		SUBSCRIPTION_ADD_SERVICES	SnapIn.php
unsubscribe xxx	Submit button	SUBSCRIPTION ADD SERVICES	SnapIn.php

[020] Turning now to a description of the backend support module 54 and related system programs, the backend support module 54 employs several scripts and routines described below to enable selection or deselection of services or applications in response to instructions received from the GUI 100.

[021] In one preferred embodiment, a sysSubscriptionQuery routine, comprising a perl script, is used to create http queries for Peabody Software service APIs using inputs to the script and two ti.conf variables. A returned value from the query is sent to the standard output (not shown) of the GUI 100.

ATTORNEY DOCKET NO.: ESFT-001/00US

CLIENT No.: E8781-2001

f E. H. Lings in the contra

Ų.

[022] A sysSubscriptionQuery: System Calling routine passes an API name as a first

parameter and, if necessary, a service identifier as a second parameter. Thus, the call

does not require a service identifier. An exemplary call for a service listing may read as

follows: /use/local/ti/bin/sysSubscriptionQuery GetServices. Whereas, a call to subscribe

to a particular service requires an identification of the service to be subscribed to and may

read as follows: /use/local/ti/bin/sysSubscriptionQuery Subscribe 100.

[023] A sysSubscriptionQuery: System Operation routine enables the hostname of a

server (not shown) to query and the path to an API script to be pulled from the ti.conf

variable SUBSCRIPTION QUERY HOST PATH. The API passed to this program is

used as part of the name of the script to call on the server (not shown). The query to the

script preferably comprises a DeviceKey, stored in SERIAL NUMBER, and optionally a

ServiceID, e.g., the name of the service to be subscribed to. Preferably, a HTTP::Request

object is created with a GET method, and an LWP::UserAgent request is made using the

HTTP::Request object. The response to the request is stored in a HTTP::Response

object. If the request is successful the content of the response is sent to the standard

output (not shown) of the GUI 100. Otherwise, an error is printed as a HTML document.

Those skilled in the art will appreciate that in some circumstances the Response object

may be parsed and formatted prior to being printed to the standard output (not shown).

[024] In one preferred form, a Sus Unsubscribe script uninstalls any RedHat Package

Managers (RPMs) associated with a service being unsubscribed, and a

SetServiceDisabled request is sent to the subscription server. In addition, a

294@01!.DOC 011901

ATTORNEY DOCKET NO.: ESFT-001/00US

CLIENT No.: E8781-2001

susUnsubscribe: System Calling script is called with the name of the service to

unsubscribe. The script may read as follows: /use/local/ti/bin/sysUnsubscripe 100.

[025] A sus Unsubscribe: System Operation script may be used to check a repository

directory in /usrlocal/redphish/snapin for a directory that matches a servicename. If there

is no matching service name, then an error is reported, and the service is not

unsubscribed. If the directory exists, a rpm -e command may be issued against each rpm

in the directory. After the packages are uninstalled the directory and the files within are

deleted.

, F

[026] A sysUpdateSubscriptions script may be used to check for a

SUBSCRIPTION ADD SERVICES array in ti.conf and for each service listed may

download the relevant files and install them on the applications management server 12.

[027] To perform service installations, a sys Update Subscriptons: System Operation

routine is preferably utilized. Thus, for each service listed in

SUBSCRIPTION ADD SERVICES a GetServiceLocation query is made to the

subscription server. The information returned from the server is used to transfer (via ftp)

the RPMs to a Peabody system. Once all of the RPMs for a service have been

downloaded they may be installed with the following command: rpm -U*.rpm. If any of

the RPM packages fail to load, then none of them will be loaded. When a loading failure

occurs, two additional loading attempts will be made to download and install the relevant

files, before a given loading process will be abandoned, and installation of the next

105130 v1/BD 294@01!.DOC

011901

service will be initiated. If all the packages install then the service name will be removed from the SUBSCRIPTION ADD SERVICES array.

[028] Table 2, below, sets forth a preferred set of data structures that may be used in accordance with the present invention.

Table 2

Statement format with default values (if any) and description

STATEMENT=<arg1>m<arg2>m <arg3>,?,<argN>

Where <arg1>is?.

SUBSCRIPTION QUERY HOST PATH=<URL>

Where <URL> is the hostname and path to the script that process the queries. This is set the first time the subscription software is run.

Default: blank

SUBSCRIPTION ID=<ID>

Where <ID> is the numerical id of the machine. This is set when the subscription software is used for the first time.

Defaults: blank

SUBSCRIPTION ADD SERVICES=<service id>

This array is used to store the services selected from the GUI that need to be installed during the next update.

SUBSCRIPTION INTERVAL=<number of days>

The number of days between updates.

Default: blank

[029] In one presently preferred form, the backend support module utilizes a HTTP API for Software Subscriptions Management. Each API call preferably is in the form of a HTTP query with parameters passed as key-value pairs, and each response preferably is a list of key-value pairs in plain text form. The API call preferably has one of the two following formats:

ATTORNEY DOCKET No.: ESFT-001/00US

CLIENT No.: E8781-2001

http://<host>/<path>/<API>/.cgi?DeviceID=<DeviceID>[&ServiceID=<Number>

or

M. <u>ا</u> پها

21 Jì.

Òl ij)

an is H. http://<host>/<path>/<GetServiceLocation.cgi?ServiceID=<Number>

where: <host> identifies the software subscription server, and the host's name is stored in

SOFTWARE UPDATE HOST; <DeviceID> is a unique number identifying the

machine and may be the serial number of, for example, the applications management

server 12 or the MAC address of the Ethernet card of the server 12 that is coupled to the

Internet; and <Number> is the numeric identifier of the requested service. It will be

appreciated by those skilled in the art that the <DEVICE ID> also may be a series of

numbers followed by a checksum, as would be the case with a typical InstaGate machine

of the type that is well known in the art.

[030] As an example, the request set forth below could represent a Subscribe request

from a machine with an Ethernet hardware address of 00:A0:CC:69:55:B2 for service

1040 – a tax software package. In the example, the subscription server is located at

subscriptions.esoft.com, the scripts are in cgi.bin, and the software is located on

blades.esoft.com in the directory /home/software/tax. In addition, the software is

accessible with the password sn2ggl3.

[031] As explained above, in a preferred form a **GetServices** request will retrieve a list of available services that can be subscribed to by a requesting machine, and it will indicate which services are already subscribed to. The parameters and return values used in accordance with a **GetServices** request may comprise those set forth in Tables 3(a) and 3(b), below.

Table 3(a)

GetServices: Parameters

Name	Туре	Description
DeviceKey	Hex Number	Composed of the digits of
		the MAC address of eht1

Table 3(b)

GetServices: Return Values

Name	Туре	Description					
ServiceID	Number	a unique identifier for the service					
ServiceTitle	String	a brief title for the service					
ServiceDesc	String	a brief description of the service					
ServiceFee	String	How much the service will cost.					
Subscribed	Number	Boolean value – 1 for subscribed, 0 for not subscribed					
StartDate	mm/dd/yy	Date subscription started if already subscribed.					
Enabled	Number	Boolean value – 1 for enabled, 0 for disabled					
CoreService	Number	Boolean value -1 indicates the service is a					

CLIENT No.: E8781-2001

		core service. If Enabled is 0 for a core						
		service then disable the system.						
Available	Number	Boolean value - 1 indicates the service i						
		available if it is a 0 then the installed service						
		must be disabled. This record is optional.						

[032] The parameters and return values used with a Subscribe request are set forth in Tables 4(a) and 4(b), and the parameters and return values used within an Unsubscribe request are set forth in Tables 5(a) and 5(b), below.

Table 4(a)

Subscribe: Parameters

Name	Туре	Description					
DeviceKey	Hex Number	Composed of the digits of the MAC address of eth1					
ServiceID	Number	A unique identifier for service					

Table 4(b)

ServiceID	Number	a unique identifier for the service					

Table 5(b)

Unsubscribe: Return Values

Name	Туре	Description					
Result	Number	Boolean value – 1 successfully					
		unsubscribed, 0 otherwise					

[033] The parameters and return values used with a GetContactInfo request are set forth in Tables 6(a) and 6(b), below. However, when a subscription server is successfully contacted, "NextDay" and "Time" fields stored within the memory (not shown) of the subscriptions management server 12 preferably will dictate when to contact the server again. If the applications management server 12 fails to contact a server at a specified time, then the applications management server 12 preferably will attempt to establish contact three additional times over the course of the next fifteen minutes, e.g., once every 5 minutes. If all three retries fail, the device should give up and try again in the number of days specified in an "Interval" field, but at the same designated "Time".

Table 6(a)

[038] Those skilled in the art will appreciate that, in addition to the systems and methodologies descrided herein, the present invention is directed to the computer software applications, programs, protocols, routines, and instructions (collectively

ATTORNEY DOCKET NO.: ESFT-001/00US

CLIENT No.: E8781-2001

"computer programming instructions") that are used to implement the above-described

features and functions. Computer programming instructions preferably are stored within

memory of the system, and may be received or transmitted via a communications

interface. When executed by a processor (not shown) of the applications management

server 12 or database management server 18, the programming instructions will enable

the system 10 to perform various methods and processes in accordance with the present

invention and, therefore, represent controllers of the system 10 and, potentially, any ASP

servers 20(a) and 20(b) that may be included within the system 10.

[039] In this document, the term "computer program product" is used to refer to any

media that may be used to provide programming instructions or data to the system 10, or

to any server or processor within the system 10, through for example, the Internet.

Examples of such media include any memory products used by or within the system 10,

any storage drives or devices (whether fixed or removable) used by or within the system

10, and any signals that may be transmitted to, from, or within the system 10.

[040] Because the invention is susceptible to various modifications and alternative

forms, specific examples thereof have been shown in the drawings and are herein

described in detail. It should be understood, however, that the invention is not to be

limited to the particular forms or methods disclosed, but to the contrary, the invention

should encompass all modifications, alternatives, and equivalents falling within the spirit

and scope of the appended claims.
